A report is given on a protein-free coagulation  
activator of plant origin, whose tolerance has been  
tested in animal experiments and whose influence on  
the coagulation time in vivo and in vitro and some of  
whose chemical and coagulation-physiological proper-  
ties have been shown to be significant in hemophilia  
therapy. A report is given on a therapeutic agent and

The present paper deals with two problems in the  
theory of dislocations: (1) the elastic properties of  
straight dislocation lines in crystals of arbitrary  
symmetry; (2) the splitting of half-dislocations in  
closest-packed lattice planes. It turns out that the  
usual splitting into pure edge dislocations and pure  
screw dislocations is only possible if the direction of

\*Crystal lattice defects, Dynamics, Shear stresses.

According to slip line observations the dynamic  
recovery of germanium (stage III of the stress-strain  
curve) is due to edge dislocation climb. The initial  
stress  $\tau_{II}$  as a function of temperature and rate can be  
derived from a theory by Weertman. (Author)
